

What is claimed is:

1. (original) A tool fitting that is provided to accommodate a rotary hammer bit and/or a chisel bit (10) and an adapter (12) characterized by means of at least one means (14, 16) for at least reducing the mobility of the adapter (12) when mounted in comparison to the mobility of the rotary hammer bit and/or chisel bit (10) when mounted.
2. (original) The tool fitting as recited in claim 1, wherein the means (14) is comprised of a centering means that is provided to center the adapter (12) and has at least one centering surface separate from a bearing surface (18) for supporting the rotary hammer bit and/or chisel bit (10).
3. (original) The tool fitting as recited in claim 2, wherein the means (14) has at least one centering surface embodied in the form of an inclined surface.
4. (original) The tool fitting as recited in claim 3, wherein the centering surface embodied in the form of an inclined surface is situated at an end surface of a component (22).
5. (currently amended) The tool fitting as recited in ~~one of the preceding claims~~ claim 1, wherein the means (16) is comprised of a locking means that is provided to give the adapter (12) an axial mobility that is at least less than the length of an idle span (20).
6. (currently amended) The tool fitting as recited in ~~one of the preceding claims~~ claim 1, wherein the means (14, 16) is at least partially integrated into a component (22, 24) having at least one other function.

7. (currently amended) The tool fitting as recited in ~~one of the preceding claims~~ claim 1,
wherein the means (14) is at least partially integrated into a main tool fitting body (22).

8. (currently amended) An adapter (12) that is provided to be inserted into a tool fitting as recited in ~~one of the preceding claims~~ claim 1, in particular having at least one receiving region (26) for a chuck for a drill bit, characterized by means of at least one means (28, 32, 58) that is provided to reduce the mobility in relation to a rotary hammer bit and/or chisel hammer bit (10) associated with the tool fitting.

9. (original) The adapter (12) as recited in claim 8,
wherein the means (28) is comprised of a centering means, which is provided for centering in relation to the tool fitting and has at least one centering surface, which is provided to correspond with a centering surface separate from a bearing surface (18) for supporting a rotary hammer bit and/or chisel bit (10).

10. (original) The adapter (12) as recited in claim 9,
wherein the means (28) has at least one centering surface embodied in the form of an inclined surface.

11. (currently amended) The adapter (12) as recited in ~~one of claims 8 through 10~~ claim 8,
wherein the means (58) is comprised of a fastening means that is provided to reduce the axial mobility in relation to the rotary hammer bit and/or chisel bit (10).

12. (currently amended) A system having a tool fitting as recited in ~~one of claims 1 through 7~~ claim 1 and having an adapter (12) as recited in ~~one of claims 8 through 11~~ claim 8.

13. (original) The system as recited in claim 12, wherein the adapter (12), when mounted, has a smaller amount of radial play (36) in relation to the tool fitting than an associated rotary hammer bit and/or chisel bit (10).

14. (original) The system as recited in claim 13, wherein the radial play (36) is less than 0.06 mm.

15. (currently amended) The system as recited in ~~one of claims 12 through 14~~ claim 12, wherein the adapter (12), when mounted, extends over an entire receiving region (34) of the tool fitting.
